

Energy Boosters

Ways to Get You Through the Day

Rebecca Jones

No amount of coaxing, pleading, or pedal pumping could get the engine in the rental car to turn over. It was going nowhere. The travelers had filled the car with unleaded fuel, but it had a diesel engine. It had been able to run a little way on the wrong fuel, but not far. And when it finally stopped, it stopped for good.

Sometimes cars and humans aren't so different. Both need the right fuel to run at maximum efficiency. Put too much of the wrong stuff in, and a breakdown may be unavoidable.

Here are some tips to keep your body humming along like a well-tuned engine, full of energy.

so-called "energy bars" are unpalatable but good for you, while candy bars are delicious but bad. Many energy bars are filled with sugar, so read labels, and look for high fiber, high protein, and limited carbs.

Nuts are among the best choices for healthy, pick-me-up snacks, nutritionists say. Nuts such as almonds, Brazil nuts, cashews, and hazelnuts are all loaded with magnesium, a mineral whose health benefits include improving heart health, decreasing the risk of diabetes, reducing stress, improving muscle functioning, and reducing insomnia.

Another super snack food is dark

The price of greatness is responsibility.

-Winston Churchill

You know you're supposed to get your eight hours!

Be Snack Smart

Strategic snacking can be a good way to smooth out dips in your energy level and avoid hunger cravings that can lead you to overeat when you finally do sit down to a full meal. So go ahead and snack. Just be as choosy in your snack selection as you are in meal planning.

chocolate, which is rich in heart-protecting antioxidants and can improve blood flow, which will energize flagging muscles. Even milk chocolate gets a thumbs up because it provides calcium for the bones. So enjoy it--in moderation.

Stay Hydrated

Just because you're not thirsty does not mean you aren't dehydrated, and even slight dehydration can leave you tired and lethargic. The answer is, of course, to drink plenty of water. If the taste of plain water doesn't excite you, consider some of the flavored varieties, keeping in mind that loads of extra sugar should be avoided.

One increasingly popular healthy hydration alternative is coconut water, which studies suggest may hydrate more quickly than plain H₂O and which contains more potassium and less sodium than other energy drinks.

Massage and More

The inherent demands of your life may lead to muscle strains, stress, and other conditions that can affect your energy levels. One of the best strategies is to get into a regular pattern of receiving massage. If you feel the need for some quick bodywork between sessions, consider self-massage possibilities.

One option is to use a foam roller, a firm foam log that comes in varying thicknesses--think of them as comfy rolling pins. You can use your own body weight to generate direct pressure as you roll over the roller, working out muscle knots.

Aromatherapy is also a great way to get a quick energy boost, as certain scents are able to fight fatigue. Queen among them is peppermint, and other lethargy busters include eucalyptus, citrus, cardamom, and even cinnamon and black pepper.

Get Some Rest

The number one myth about sleep is that you can get by on six hours a night. The truth is that the further away you deviate from getting eight hours sleep a night--and some people get too much, not too little--the greater the risk of cardiovascular disease, depression, obesity, and a host of other maladies.

Make sleep a priority. Get on a regular schedule, stick to it, and stop allotting to sleep only whatever time is left over after everything else gets accomplished. Once you've gone to bed, though, you have to actually go to sleep, and for many people that's no easy feat.

Caffeine is often the culprit. Caffeine is a great pick-me-up first thing in the morning, but it has a six- to seven-hour "half-life," meaning that half the caffeine in that cup of coffee you consumed to ward off the 3:00 p.m. doldrums will still be lingering in your bloodstream after the 10:00 p.m. news.

Another stimulant many people don't often consider is light--particularly light from a computer or television screen. Dim light from a soft reading lamp is fine, but the bright blue light of electronic devices sears itself into our minds and fools them into thinking it's still daylight outside, which makes falling asleep seem unnatural.

Heat, whether internal or external, will also disrupt sleep. The ideal room temperature for sleeping is around 65 degrees. The cool air then wicks away heat from your body, which allows you to fall asleep. Anything you do to

increase your body's core temperature, like exercising or eating a big meal right before bedtime, makes it harder for your body to cool down to a comfortable sleeping temperature.

Naps are tricky luxuries. Taken wisely and in moderation, they'll restore mental alertness and fuel you through a long afternoon. But too long a nap or a poorly-timed nap will leave you feeling drained after you get up, and will make it harder to fall asleep come bedtime. Timing also matters. Grab a morning nap to boost your creativity and mental alertness or a late-afternoon nap to restore lost physical energy and boost your immune system--a nap around noon provides a little of both.

Snack smart and benefit from sustained energy throughout the day.

Nature's Nutritional Wonder

Cruciferous Vegetables

Cruciferous vegetables are powerful foods that can help prevent many forms of cancer, reduce existing cancer tumors, and aid in the prevention of heart disease. Broccoli, cabbage, cauliflower, arugula, kale, and Brussels sprouts all contain isothiocyanates--a group of chemicals that break down carcinogens in the body, helping to metabolize toxins. Studies show that people who eat two to three servings of cruciferous vegetables each week lower their risk of breast cancer, colon cancer, and lung cancer. A National Cancer Institute study found that eating three helpings of crucifers a week dropped prostate cancer risk by 50 percent. The powerful chemicals in these veggies also reduce homocysteine levels, a known precursor to heart disease.

Cruciferous vegetables are low in calories and high in fiber and the chromium found in these foods helps regulate blood sugar and insulin function, key factors in keeping diabetes at bay. Even with all the benefits that

crucifers provide, many people refuse to eat them because of their strong taste. But a little creativity can go a long way in making these wonderful foods palatable: try cream of broccoli soup, cauliflower au gratin, stuffed cabbage, or the recipe below--the possibilities are endless.

BRUSSELS SPROUTS FOR THE MEAT-AND-POTATOES EATER

1 pound fresh Brussels sprouts, washed, stems trimmed, and outer leaves removed
1 tablespoon extra virgin olive oil
2 tablespoons unsalted butter
3 tablespoons cider vinegar
1/4 cup grated Parmesan cheese
Salt and pepper, to taste

Thinly slice Brussels sprouts, either in a food processor fitted with a slicing blade, or by hand. Heat a heavy, nonstick skillet. Add olive oil and butter, swirling the pan so that the butter melts. Saute sliced Brussels sprouts for 5 minutes. Add cider vinegar and grated Parmesan, stirring briefly to incorporate. Add salt and freshly

ground black pepper to taste. Serves four--who will all be healthier for it!

Cruciferous veggies help ward off disease.

The Sunshine Vitamin

Shelley Burns

In the world of skin health, we focus on ways to improve skin quality. We work to prevent acne, cellular damage, dryness, and wrinkles. It is less common to discuss how a skin-care strategy may increase risk of developing other health conditions.

Skin cancer is one example. To prevent skin cancer, we protect ourselves with sunscreen--especially during the summer months. But by using sunscreen we are blocking the absorption of vitamin D, the "sunshine" vitamin.

Vitamin D is fat soluble and contains powerful antioxidant and anticarcinogenic properties that can prevent premature aging and cellular damage. Solid research indicates that vitamin D plays a role in reducing the risk of cancer, specifically breast, colon,

and prostate cancers. Vitamin D has been associated with preventing diabetes by reducing insulin sensitivity. It also improves heart health, reduces the risk of multiple sclerosis, strengthens bones, and decreases the effects of seasonal affective disorder.

Vitamin D can help resolve skin conditions like psoriasis, as it plays a role in skin cell regulation, including cell turnover and growth. Vitamin D can be effective in reducing the itching and flaking associated with this disorder. Ultraviolet B (UVB) treatments have long been used successfully in treating psoriasis because UVB produces vitamin D in the body.

Getting between 5-10 minutes of direct sun exposure daily on the arms, face, hands, and back (without sunscreen) can

provide enough vitamin D to meet your daily requirements, though sun exposure does present a risk. Because it is difficult to obtain enough vitamin D through food, many prefer to use supplements. Research on the health benefits of ingesting vitamin D led experts to advise an intake of 25-50 micrograms daily.
